RKJJ AD 2.23 ADDITIONAL INFORMATION

1. Special VFR not Authorized.

2. Bird concentrates in the vicinity of airport

The birds' feeding areas consist of surrounding farmland and greens along the river and they frequently move to get their habitat (located QDR 300°, 5 000 m from end of RWY 22R). In the winter, the ducks frequently move at the rise and the set of sun and the lapwings frequently fly before sunset. In the summer, the egrets at the rise of sun and the snipes at the set of sun fly most frequently.

The flying heights are various such as from the ground to 600 m.

The control tower is going to provide the information on the activity of birds and estimated height to the pilots if it is possible. At the same time, the pilots are informed to turn on the landing light in the process of taking off, approach for landing, climbing, and descending as far as the designed limit of aircraft facility allows.

To eliminate the birds, we are using the blank cartridge, signal gun, and loudspeaker. As well, we are operating several equipments including explosive sounds, alarm, sky dancer. For environmental management, we are carrying out various activities simultaneously to prevent the installation of rubbish dump and wastewater treatment plant, and to limit the kinds of trees and the farming in the airport.

3. Use extreme caution, field is surrounded by high angle firing range(RK R14).
